FIVE KEY DRIVERS

1. Hidden Costs

With pressure to reduce business costs in general, a workplace assessment can help you identify the hidden costs in your organisation. Most organisations have underutilised technology, paper-intensive processes and unsecured archives. A Workplace Assessment often reveals surprising findings, such as a less-than-optimum IT infrastructure, a higher-than-anticipated environmental impact, unacceptable data security or inefficient work processes.

2. Document Infrastructure

The pressures involved with managing multi-vendor environments and multiple supplier contracts are more complex than ever. A full understanding of your existing IT, document and print infrastructure and user behaviours – knowing how your IT investments are being used and who's accessing what, when and where – is critical. The insights uncovered can open up opportunities to tighten security, increase automation, meet sustainability and corporate responsibility goals, enhance user experiences or simply monitor your ROI on previous initiatives.

3. Systems Intergration

Most organisations have ever-evolving IT requirements to meet regulatory or changing clients or internal user needs. If you are one of those organisations, you will appreciate the challenges this brings. Especially with the prevalence of distributed teams and offices and a growing mobile workforce. Even if you are a single office, the process of getting work done has moved far from the workplace. Integrating systems and managing data streams across platforms requires careful planning.

4. Strategy and Process

Creating intelligent workplace efficiency may start with connecting, controlling and managing your IT Infrastructure. But it doesn't end there. It involves automating and streamlining processes to eliminate manual steps and make it easier to work, share and collaborate, and free-up time to focus on higher-value tasks and initiatives.

5. Security and Compliance

Are you using the most advanced technology to ensure that your systems, documents and data are safe? It's a more complex challenge than you may think. There are many endpoints – multifunction printers (MFPs), mobile and networked devices, documents and the users themselves. Anything less than an end-to-end solution that integrates security and control across your entire print IT infrastructure – including authentication, traceability and auditable workflows – puts your company at risk.

INTRODUCING THE ERA OF INTELLIGENT WORK
